Abstract. Sparse stochastic processes are continuous-domain processes that admit a parsimonious representation in some matched wavelet-like basis. Such models are relevant for image compression, compressed sensing, and, more generally, for the derivation of statistical algorithms for solving ill-posed inverse problems.

In this paper, a particular class of such processes are introduced, having a root that is not constant, but is stochastic, and varying around unity. In this way, the process is stationary for some periods, and mildly explosive for others. However, on average, the series may seem to be  $I(1)$ , according to standard tests.
