Published as Volume 70 in the series Methods in Cell Biology, this second edition is a collection of review articles by experts in the field of confocal microscopy and live-cell imaging. Included is an broad introduction to laser scanning techniques and instruments, a discussion of scanning-disk instruments, and a summary of multiphoton imaging in the biological sciences.

Recommended Books on Confocal Microscopy
Confocal microscopy offers several advantages over conventional widefield optical microscopy, including the ability to control depth of field, elimination or reduction of background information away from the focal plane (that leads to image degradation), and the capability to collect serial optical sections from thick specimens. The basic key to the confocal approach is the use of spatial ...

Confocal Microscopy - Introduction | Olympus Life Science
The theoretical resolution of confocal microscopy is twice that of two-photon microscopy [15]. When maximum resolution is required, two-photon microscopy is typically coupled with confocal detection (pinhole) [16], or by two-beam interference illumination combined with confocal detection [17]. The imaging process is similar to confocal microscopy.

The confocal microscopy facility provides researchers with the ability to visualize a variety of samples, from monolayers and small organisms, such as developing fly and fish embryos, to very thick sections from brain and other organ tissues.This is accomplished using a variety of optical imaging modalities, including laser point (LSCM) and field scanning confocal (CSU). Total Internal ...

Confocal microscopy, most frequently confocal laser scanning microscopy (CLSM) or laser confocal scanning microscopy (LCSM), is an optical imaging technique for increasing optical resolution and contrast of a micrograph by means of using a spatial pinhole to block out-of-focus light in image formation. Capturing multiple two-dimensional images at different depths in a sample enables the ...

Over 70% of eyes (10/14) showed increased crystal volume from 6 to 8 months, while only 14% of eyes (2/14) showed increased crystal volume from 8 to 10 months of age. Overall, these findings suggest that the optimal age to evaluate the effects of therapy on corneal cystine crystal formation using in vivo CM should be from 3 to 6 months of age.

Confocal optical microscopy is a technique for increasing the contrast of microscope images, particularly in thick specimens. By restricting the observed volume, the technique keeps overlying or nearby scatterers from contributing to the detected signal.

We present confocal fluorescence lifetime imaging microscopy in the second near-infrared (NIR-II) window to assess the morphological and biochemical information of live samples. A home-built superconducting single-photon detector (SSPD) was used to facilitate the NIR-II fluorescence lifetime measurement. The SSPD has many advantages, including high sensitivity to NIR-II signals (detection ...
