I'm studying differential equations (specifically Laplace Transforms) right now with my college assigned 'Differential Equations with Application and Historical Notes'-George F Simmons. While I like the text, I'm not a big fan of the fact that there are not many solved examples and a solution manual isn't available.

One of the stages of solutions of differential equations is integration of functions. There are standard methods for the solution of differential equations. Should be brought to the form of the equation with separable variables  $x$  and  $y$ , and integrate the separate functions separately. To do this sometimes to be a replacement.

Some differential equations have solutions that can be written in an exact and closed form. Several important classes are given here. In the table below,  $P(x)$ ,  $Q(x)$ ,  $P(y)$ ,  $Q(y)$ , and  $M(x,y)$ ,  $N(x,y)$  are any integrable functions of  $x$ ,  $y$ , and  $b$  and  $c$  are real given constants, and  $C_1, C_2, \dots$  are arbitrary constants (complex in general). The differential equations are in their equivalent and alternative forms that lead to the solution through integration.
