Using the intercostal artery perforator; flaps in breast surgery has recently been reported by our studies. 9 The intercostal perforators can be found anterior to the LD border, making the flap dissection possible without disturbing or sacrificing the TD vessels. These perforators pierce the serratus muscle and turn medially, running above the LD muscle, and are usually accompanied by a sensate branch to the skin of the back.

Anatomy. An omental pedicle flap is easy to harvest, has a reliable blood supply and a generous surface area, and is often used for the obliteration of pelvic dead space and the isolation of bowel anastomoses from adjacent structures . Therefore, we describe a digitalized model of perforator flaps of the forearm using angiography and a 3-dimensional imaging technique, Mimics (Materialise, Leuven).¹⁵ The advantage of this technique includes its clear display of vascular network of the source artery with its adjacent vessels. The objective of this report is to comprehensively document the 3-dimensional anatomy of the proximal ulnar artery perforators and to demonstrate the clinical applications of proximal ulnar artery ...

The anatomical description of the transverse and oblique routes perforators take as they course through the rectus described by Rozen et al. was cited as support of the argument that fibers must be routinely divided when harvesting a DIEP flap. 18 Others have reported similarly, with commentary on the unpredictable routes perforators take as they pass through rectus structure. 14, 19, 20 These findings are in stark contrast to reports by Munhoz et al. and others that describe orderly ...
