A soil is said to be elastic when it suffers a reduction in volume (or is changed in shape and bulk) while the load is applied, but recovers its initial volume immediately the load is removed. The most important characteristic of the

elastic behaviour of soil is that no matter how many repetitions of load are applied to it, provided that the stresses set up in the soil do not exceed the “yield stresses” the soil does not become permanently deformed.

Balmer (1958) found that the elastic modulus of soil-cement mixture increases with cement dosage and varies from 100,000 psi (689 MPa) to 2,000,000 psi (13.79 GPa) for granular soil-cement mixture and from 260,000 (1.79 GPa) to 760,000 psi (5.24 GPa) for fine-grained soil-cement mixture.

Fig. 4 shows approximate solutions for the lining when there is a void. The tunnel is assumed to be built in rock and the range of the void is 60° . These solutions satisfy the boundary condition at equidistantly selected N discrete points at the ground-lining interface $r = R$. The vertical axis $f_r(2)^*$, $u_r(2)^*$,

Elastic modulus of soil is the parameter and the measure of stiffness of soil. Sometimes, it is also termed as Young's modulus. It is found by dividing the
