Open-channel flow, a branch of hydraulics and fluid mechanics, is a type of liquid flow within a conduit with a free surface, known as a channel. The other type of flow within a conduit is pipe flow. These two types of flow are similar in many ways but differ in one important respect: the free surface. Open-channel flow has a free surface, whereas pipe flow does not. Central Arizona Project channel.

Open-channel flow - Wikipedia

An open channel is a free surface structure, either natural or man-made, through which water flows, and it is important to keep up-to-date on its measurements. When measuring the flow of water in open channels, there are many different options one can choose to get the job done, depending on the type and size of water flow.

Flow Section Channels - Geometric Relationships; The volume flow in the channel can be calculated as. $q = A v = A (k n / n) R h^{2/3} S^{1/2}$ (3) where. q = volume flow (ft³/s, m³/s) A = cross-sectional area of flow (ft², m²) Example - Flow in an Open Channel. A channel with the shape of an half circle is 100% filled.

The flow in open channel flow is classified as steady or unsteady. The steadiness or unsteadiness of the flow is greatly dependent on the velocity of the flowing fluid, the discharge and the flow depth. Steady flow refers to a flow whereby the amount of water entering the channel is equivalent to the amount of water leaving the channel.

1 FLOW IN OPEN CHANNELS $Re = RhV/\nu$ Usually, $Rh > 0.1$ ft and $V > 1$ ft/s and $v_{water}=10^{-5}$ ft²/s Hence, $Re = 0.1 \times 1/10^{-5} = 10^4$ $Re > 750$ \therefore FLOW IN OPEN CHANNELS IS ALMOST ALWAYS TURBULENT APPLY ENERGY EQUATION $p_1/\gamma + z_1 + V_1^2/2g = p_2/\gamma + z_2 + V_2^2/2g + h_L$ But, $p_1/\gamma + z_1 = y_1 + S_0 \Delta X$ AND $p_2/\gamma + z_2 = y_2$ $y_1 + S_0 \Delta X + V_1^2/2g = y_2 + V_2^2/2g + h_L$ If Channel bottom is Horizontal and
