Hydraulics In Civil Engineering

Hydraulic engineering as a sub-discipline of civil engineering is concerned with the flow and conveyance of fluids, principally water and sewage. One feature of these systems is the extensive use of gravity as the motive force to cause the movement of the fluids. This area of civil engineering is intimately related to the design of bridges, dams, channels, canals, and levees, and to both sanitary and environmental engineering. Hydraulic engineering is the application of the principles of fluid m

In Civil Engineering Hydraulics we study fluid properties and behavior in different civil engineering applications, such as, flow of water through canals for irrigation, flow through public supply pipelines and water drainage system. In Civil Engineering Hydraulics we also study the effect of static fluid, such as, the pressure and force exerted by water stored in dams on its walls.
