### Incomplete Dominance And Codominance Answer

Incomplete dominance is when the phenotypes of the two parents blend together to create a new phenotype for their offspring. An example is a white flower and a red flower producing pink flowers. Codominance is when the two parent phenotypes are expressed together in the offspring.

### Answered: Define incomplete dominance,... | bartleby

Closely related to incomplete dominance is codominance, in which both alleles are simultaneously expressed in the heterozygote. We can see an example of codominance in the MN blood groups of humans (less famous than the ABO blood groups, but still important!). A person's MN blood type is determined by his or her alleles of a certain gene.

### Incomplete dominance, codominance & multiple alleles ...

Codominance and Incomplete dominance are two types of genetic inheritance. Codominance essentially means that no allele can block or mask the expression of the other allele. On the other hand, incomplete dominance is a condition in which a dominant allele does not completely mask the effects of a recessive allele.

### Difference Between Incomplete Dominance and Codominance

In incomplete dominance, a mixture of the alleles in the genotype is seen in the phenotype. In complete dominance, only one allele in the genotype is seen in the phenotype. In codominance, both alleles in the genotype are seen in the phenotype.

### Incomplete and codominance worksheet Flashcards | Quizlet

With incomplete dominance we get a blending of the dominant & recessive traits so that the third phenotype is something in the middle (red x white = pink). In COdominance, the "recessive" & "dominant" traits appear together in the phenotype of hybrid organisms.
