Brilliant Solutions

Chapter 6

4 D. Zagier The modular group takes its name from the fact that the points of the quotient space  $\Gamma \backslash \mathbb{H}$  are moduli (= parameters) for the isomorphism classes of elliptic curves over  $\mathbb{C}$ . To each point  $z \in \mathbb{H}$  one can associate the lattice  $\Lambda_z = \mathbb{Z}z + \mathbb{Z}1 \subset \mathbb{C}$  and the quotient space  $E_z = \mathbb{C}/\Lambda_z$ , which is an elliptic curve, i.e., it is at the same time a complex

n. An effective proof of Theorem 1 for small  $d$  gives the following theorem. Theorem 2. If  $1 \leq d \leq 8$ , then  $J_{d,n}(X)$  is hyperbolic for every  $n \geq 0$ . Theorem 1 follows from a general phenomenon that Jensen polynomials for a wide class of sequences can be modeled by the Hermite polynomials  $H_d(X)$ , which we define (in a somewhat ...
