Lecture 7 Circuit Analysis Via Laplace Transform
Circuit analysis via Laplace transform 7 (7, thus, LRCCircuits can be solved exactly like static circuits, except that all variables are Laplace transforms, not real numbers. 1 capacitor and inductor have branch relations $i_C = C v_C'(t)$, $v_L = s L i_L(t)$ interpretation: an inductor is like a resistance sL in series with an independent voltage source $i_L(t)$ and a capacitor is like a resistance $1/sC$ in parallel with an independent current source $i_C(t)$. These resistances are called impedances. 1 ...

circuit analysis is to derive the smallest set of simultaneous equations that completely define the operating characteristics of a circuit. In this lecture we will develop two very powerful methods for analyzing any circuit: The node method and the mesh method. These methods are based on the systematic application of Kirchhoff’s laws.

Circuit Analysis using the Node and Mesh Methods
The curve is one of the most powerful tools for circuit analysis and we will use it extensively in characterizing circuits and electronic components. i/v v i 0 Vs Vs/R slope is 1/R operating point Figure 6. i/v curve of a resistor 6.071/22.071 Spring 2006. Chaniotakis and Cory 5 .
