Because this is a bit more complicated, we will show you how to solve multi-step equations on two examples. The first example is a fairly simple multi-step equation with integers that has a variable on both sides of the equation. $n + 2 = -4 + 2n$. The first thing we have to do here is to get all the variables on one side and all the numbers on the other. It does not matter on which ones you put on the right side of the equation and which ones on the left - you will still get the same result ...

These multi-step equations can get a bit long and difficult. Sometimes, there is an unknown on both sides of the equation. We can't solve until it is on only one side. So, we must first move one of the terms to the other side by using an inverse operation. Example 4: Solve the equation. $5p - 4 = 3p + 20$
