The Origami oscillator uses wavefolding to create complex harmonic distortion from basic waveforms. The input waveform to the wavefolder can be varied between a sine wave and an asymmetrical waveform (triangle/flattened sine) to change the basic timbre. This waveform is then fed into the wavefolding algorithm where the amount of folding (SHAPE) increases the gain at the input of the wavefolder.

Abstract. Self-folding of complex origami-inspired structures from flat states allows for the incorporation of a multitude of surface-related functionalities into the final 3D device. Several self-folding techniques have therefore been developed during the last few years to fabricate such multi-functional devices.

This method of origami design was developed by Robert Lang, Meguro Toshiyuki and others, and allows for the creation of extremely complex multi-limbed models such as many-legged centipedes, human figures with a full complement of fingers and toes, and the like. The crease pattern is a layout of the creases required to form the structure of the model. Paradoxically enough, when origami designers come up with a crease pattern for a new design, the majority of the smaller creases are relatively ...
