Power series solutions is one of the most powerful analytic methods that physicists have for solving linear differential equations. The idea is very simple, make an Ansatz that a power series solution exists, but the coefficients in the power series are unknown.

Method/Example

The idea of the power series method is to put the expression above into the differential equation, and then find the values of the coefficients a_n . The Power Series method can be summarized as follows:

(1) Choose an x_0 and write the solution y as a power series expansion centered at a point x_0 , $y(x) = \sum_{n=0}^{\infty} a_n (x - x_0)^n$:

Since the method for finding a solution that is a power series in $x - x_0$ is considerably more complicated if x_0 is a singular point, attention here will be restricted to power series solutions at ordinary points.
