## **The Prosthodontic Management of Endodontically Treated ...**

The restoration of endodontically treated teeth is one of the most challenging situations of the dentist's clinical practice, because it involves procedures related to several areas, such as...

## **Prosthodontic Management of Endodontically Treated Teeth ...**

Endodontically treated molar teeth should receive cuspal coverage, but in most cases, they do not require a post. Unless the destruction of coronal tooth structure is extensive, the pulp chamber and canals provide adequate retention for a core buildup. Molars must primarily resist vertical forces.

## **Management of Endodontically Treated Teeth - An Overview**

14. □ Of paramount importance to the longevity of the restored endodontically treated tooth is the presence of adequate height (1.5-2 mm) of sound tooth structure, or ferrule, between the core and the crown margin. A tapered post without a ferrule predisposes the tooth to root fracture, due to occlusal forces being directed internally down the canal.

## **Prosthetic restoration of endodontically treated tooth**

**HISTORY AND EVOLUTION** Restoration of endodontically treated tooth by a post to retain a crown dates back more than 250 years. In 1747, Pierre Fauchard a French dentist used "Tenons" which were metal posts (Gold or silver) into the roots of teeth to retain bridges.
