NONLINEAR PUSHOVER ANALYSIS OF SEISMIC LOAD ON MULTI ...

Pushover analysis is a static procedure that uses a simplified nonlinear technique to estimate seismic structural deformations. Structures redesign themselves during earthquakes. As individual components of a structure yield or fail, the dynamic forces on the building are shifted to other components.

Where can I find a detailed example of pushover analysis?

Most of pushover methods are used for estimating the seismic demands of buildings. Multi-mode Adaptive Displacement-based Pushover (MADP) analysis procedure is proposed. MADP is developed for estimating the seismic demands of RC moment-resisting frames. Case study of RC frames under different ground motion intensities is conducted.

This approach is also known as "pushover" analysis. A pattern of forces is applied to a structural model that includes non-linear properties (such as steel yield), and the total force is plotted against a reference displacement to define a capacity curve.

Seismic analysis - Wikipedia

Pushover analysis results (i.e., pushover curve, sequence of member yielding, building capacity and seismic demand) are very sensitive to the load pattern. The lateral load patterns should approximate the inertial forces expected in the building during an earthquake.
