and will raise queen cells on the only viable brood, the comb with eggs. Stage 4. 4 days later (total 11 days) (necessary if an ordinary brood comb with some older brood is brought from the breeder)

1. In the cell raiser check the breeder comb for queen cells. Destroy any that are already sealed.
2. Check there are enough bees in the hive to one side.

Simple Queen Rearing - honey, bee

Bee breeding and queen rearing are not the same, but many beekeepers think they are. Queen rearing is the process of producing queen honey bees by whatever method is chosen by the beekeeper, whereas breeding is the process of selection that brings about the lines to be propagated by queen rearing and any culling that is carried out.

the beekeeper rather than allowing this to be the choice of the bees. The beekeeper may want more queens;

Bees for development | Rearing and breeding bees

Mating Hives Small hives with just a cup-full of bees are used as mating hives. The queen doesn't mate in them; the small number of bees is just enough to look after her and once the queen has matured and flies from the small colony to mate on the wing, she will start to lay eggs in these small hives.
