## Solving

## Exponential Logarithmic Equations

you will have to use logarithms. Taking logarithms will allow us to take advantage of the log rule that says that powers inside a log can be moved out in front as multipliers. By taking the log of an exponential, we can then move the variable (being in the exponent that's now inside a log) out in front, as a multiplier on the log.

Logarithmic

Purplemath

Solve  $\log_5 3x^2 =$

1.96. Give  $x$  to the  
hundredths place. 5

$1.96 = \log_5 3x^2$ . Rewrite  
this logarithmic

equation as an  
exponential equation.

$23.44127... = 3x^2$ .

Evaluate  $5^{1.96}$ .

$7.81375... = x^2$ .  $x =$

$\pm 2.7953...$   $x \approx \pm 2.80$ .

Solve as you normally  
would. In this case,

divide both sides by 3,

Steps to Solve  
Exponential Equations  
using Logarithms 1)  
Keep the exponential  
expression by itself on  
one side of the  
equation. 2) Get the  
logarithms of both  
sides of the equation.  
You can use any bases  
for logs. 3) Solve for  
the variable. Keep the  
answer exact or give  
decimal

Yes, this can be done.

We can see that  $(\log 7000) / (\log 100)$  is equivalent to the correct answer given, which is  $[(\log 7) + 3] / 2$ , using definitions and laws of logarithms:

$$\begin{aligned}(\log 7000) / (\log 100) &= \\ [\log (7 \cdot 10^3)] / [\log & \\ (10^2)] &= [(\log 7) +\end{aligned}$$
