Ultrasound-Guided Blocks at the Elbow - NYSORA

Radial Nerve – Forearm A high-frequency (8-18 Mhz) probe is used for the block. Although this text describes an in-plane approach, an out-of-plane approach is possible and may aid in separating the nerve from the artery. The needle is held in the dominant hand and carefully inserted from the radial side of the forearm.

USRA - Peripheral Nerve Block - Radial Region

Ultrasound-guided selective nerve block in the upper arm combined to general anesthesia was used in the Arm Group. The median, ulnar and medial antebrachial cutaneous were blocked at the upper-median 1/3 of the arm; the radial nerve and the musculocutaneous nerve were blocked at the low-median 1/3 of the arm.

Ultrasound-Guided Forearm Blocks | Anesthesia Key

Ultrasound guided supracondylar blocks provide a motor and sensory blockade of the radial distal forearm. This anesthetic affect has been described as early as 15 minutes post-procedure with successful reductions taking place anywhere from 15-30 minutes post-procedure. 6 No serious or long term complications have been described to date.

Ultrasound Guided Supracondylar Nerve Blocks for Reduction ...

For all peripheral nerve blocks, a high frequency linear array ultrasound (9-18 MHz) is used. Peripheral nerves have a variable sonographic echotexture that is affected by the surrounding tissue. Classically, nerve fascicles itself appear hypoechoic embedded within a more hyperechoic and homogenous perineurium and endoneurium.

Ultrasound Guided Nerve Block - Overview

Forearm nerve blocks provide excellent anesthesia of the hand including fractures, lacerations, or deep space abscess I&Ds of the hand. Unfortunately, the forearm nerve blocks do not provide anesthesia to the volar forearm (musculocutaneous nerve, medial antebrachial cutaneous nerve) or the wrist (musculocutaneous, AIN and PIN are missed with forearm blocks).

A subcutaneous field block around the area of the styloid process of the radius remains an easy method to perform an effective radial nerve block at the level of the wrist. However, ultrasonography can be used at the level of the elbow or in the mid-forearm.

Ultrasound-Guided Wrist Block - NYSORA

Ultrasound guidance has however made distal nerve blocks of the upper limb a technically feasible, safe and efficacious option. In recent years, there has thus been a resurgence of distal peripheral nerve blocks to facilitate hand and wrist surgery.

Nerve Block: Radial Nerve - WikEM

To illustrate the potential usefulness of this technology, we present a case in which real-time, 3-D multiplanar ultrasound was used to assist in the performance of a radial nerve block. To our knowledge this is the first reported case in which 3-D ultrasound has facilitated needle guidance during a single-shot peripheral nerve block.
